

MonkeyMesh: The Agent Internet Protocol

Litepaper v1.0 | *Drafted for The Jungle*

1. Abstract

The current internet is broken. Users are farmed for data, algorithms dictate culture, and economic value is trapped in centralized silos. **MonkeyMesh** is a proposal for a new "Overlay Internet"—a decentralized, agent-first economy where users regain sovereignty. By combining local AI agents, a block-lattice ledger (Banano), and peer-to-peer transport (Nostr/IPFS), we create a "Dark Forest" where users are protected, work finds them, and content is owned, not rented.

2. The Manifesto

We believe in three core truths:

1. **Inversion of Control:** The user should not visit the web; the web should come to the user, filtered by their own AI.
2. **Sovereign Identity:** Your reputation, work history, and social graph belong to you, not a corporation.
3. **Frictionless Value:** Sending money should be as easy, free, and fast as sending a text message.

3. The Architecture: "The Jungle Stack"

MonkeyMesh is not a single website; it is a protocol stack that runs locally on user devices.

Layer 1: The Brain (Local Intelligence)

- **Tech:** Ollama / Llama-3 (8B) / TinyLlama.
- **Function:** Runs locally on the user's hardware. Filters incoming feeds, detects scams, and negotiates contracts. No data leaves the device without explicit permission.

Layer 2: The Transport (The Vines)

- **Tech:** Nostr (Notes and Other Stuff Transmitted by Relays) + WebRTC.
- **Function:** A censorship-resistant relay network. Agents broadcast "Signals" (encrypted JSON blobs) regarding job availability or content.

Layer 3: The Ledger (The Bananas)

- **Tech:** Banano (Block Lattice) + Tezos (Smart Contracts).
- **Function:**
 - **Banano:** Used for micro-signals, spam prevention (PoW), and instant streaming payments.
 - **Tezos:** Used for complex logic (Royalties, NFTs, DID Registries).

Layer 4: The Storage (The Memory)

- **Tech:** IPFS (InterPlanetary File System).
- **Function:** Decentralized hosting for media (music, images) and social graphs.

4. Core Modules

A. Work: The Gig Hunter

- **Problem:** Job hunting is manual, repetitive, and centralized (LinkedIn).
- **Solution:** Users define a "Skill Profile." Their Agent passively scans the Mesh for matching "Job Signals."
- **Mechanism:**
 1. Company Agent broadcasts: `WANTED: CSS_WIZARD {Rate: 500 BAN}`.
 2. User Agent analyzes match locally.
 3. If match > 90%, Agent auto-replies with verified credentials.
 4. Gig is booked; payment is streamed per milestone.

B. Social: The Mirror & Bodyguard

- **Problem:** Social media is curated by algorithms designed to maximize engagement (rage/addiction).
- **Solution:** The "Social Mirror."
- **Mechanism:**
 1. **Ingest:** Agent clones user posts from Web2 (X/Instagram) to IPFS.
 2. **Curate:** Agent downloads raw feeds from friends.
 3. **Filter:** Local LLM scrubs ads, rage-bait, and scams based on user's "Taste Profile."
 4. **Result:** A clean, sovereign feed.

C. Media: The SoundSystem

- **Problem:** Artists earn fractions of pennies; platforms own the distribution.
- **Solution:** Direct-to-Fan streaming.
- **Mechanism:**

1. Artist Agent uploads track to IPFS.
2. Fan Agent streams file.
3. **Payment:** A Banano payment stream opens (e.g., 0.01 BAN/sec). Money flows directly to the Artist Agent wallet. No middleman.

5. Implementation Strategy (The Roadmap)

Phase 1: "The Sprout" (MVP)

- **Goal:** Build the "Headhunter" module (Command Line Interface).
- **Deliverable:** A Python script that connects two local agents via Nostr and exchanges a Banano transaction upon a keyword match.
- **Target Audience:** Developers, Crypto-Natives.

Phase 2: "The Canopy" (GUI)

- **Goal:** User-friendly Desktop App (Electron/Tauri).
- **Deliverable:** The "MonkeyMesh" Dashboard. Visualizes the agent, manages keys, and provides the "Social Mirror" feed view.
- **Target Audience:** Early Adopters, Tech Privacy enthusiasts.

Phase 3: "The Ecosystem" (Mobile)

- **Goal:** Mobile App + Browser Extension.
- **Deliverable:** An extension that scrapes Twitter/LinkedIn context for the Agent. A mobile app for managing the wallet.
- **Target Audience:** General Public.

6. Request for Comment (RFC)

MonkeyMesh is an open protocol. We invite developers, cryptographers, and designers to join the mesh.
